*To my wife, Sarah,
and to my children,
Dane Arash and Daisy Bitá*

Preface to Second Edition

Based on my own experience of teaching from the first edition, and more importantly based on the comments of the adopters and readers, I have made some significant changes to the new edition of the book: Part I is substantially rewritten, Part VIII has been changed to incorporate Clifford algebras, Part IX now includes the representation of Clifford algebras, and the new Part X discusses the important topic of fiber bundles.

I felt that a short section on *algebra* did not do justice to such an important topic. Therefore, I expanded it into a comprehensive chapter dealing with the basic properties of algebras and their classification. This required a rewriting of the chapter on operator algebras, including the introduction of a section on the representation of algebras in general. The chapter on *spectral decomposition* underwent a complete overhaul, as a result of which the topic is now more cohesive and the proofs more rigorous and illuminating. This entailed separate treatments of the spectral decomposition theorem for real and complex vector spaces.

The inner product of relativity is non-Euclidean. Therefore, in the discussion of tensors, I have explicitly expanded on the indefinite inner products and introduced a brief discussion of the subspaces of a non-Euclidean (the so-called semi-Riemannian or pseudo-Riemannian) vector space. This inner product, combined with the notion of algebra, leads naturally to *Clifford algebras*, the topic of the second chapter of Part VIII. Motivating the subject by introducing the Dirac equation, the chapter discusses the general properties of Clifford algebras in some detail and completely classifies the Clifford algebras $C_{\mu}^{\nu}(\mathbb{R})$, the generalization of the algebra $C_3^1(\mathbb{R})$, the Clifford algebra of the Minkowski space. The *representation* of Clifford algebras, including a treatment of *spinors*, is taken up in Part IX, after a discussion of the representation of Lie Groups and Lie algebras.

Fiber bundles have become a significant part of the lore of fundamental theoretical physics. The natural setting of gauge theories, essential in describing electroweak and strong interactions, is fiber bundles. Moreover, differential geometry, indispensable in the treatment of gravity, is most elegantly treated in terms of fiber bundles. Chapter 34 introduces fiber bundles and their complementary notion of *connection*, and the *curvature form* arising from the latter. Chapter 35 on *gauge theories* makes contact with physics and shows how connection is related to potentials and curvature to fields. It also constructs the most general gauge-invariant Lagrangian, including its local expression (the expression involving coordinate charts introduced on the underlying manifold), which is the form used by physicists. In Chap. 36,

by introducing vector bundles and linear connections, the stage becomes ready for the introduction of *curvature tensor* and *torsion*, two major players in differential geometry. This approach to differential geometry via fiber bundles is, in my opinion, the most elegant and intuitive approach, which avoids the ad hoc introduction of covariant derivative. Continuing with differential geometry, Chap. 37 incorporates the notion of inner product and metric into it, coming up with the *metric connection*, so essential in the general theory of relativity.

All these changes and additions required certain omissions. I was careful not to break the continuity and rigor of the book when omitting topics. Since none of the discussions of numerical analysis was used anywhere else in the book, these were the first casualties. A few mathematical treatments that were too dry, technical, and not inspiring were also removed from the new edition. However, I provided references in which the reader can find these missing details. The only casualty of this kind of omission was the discussion leading to the spectral decomposition theorem for compact operators in Chap. 17.

Aside from the above changes, I have also altered the style of the book considerably. Now all mathematical statements—theorems, propositions, corollaries, definitions, remarks, etc.—and examples are numbered consecutively without regard to their types. This makes finding those statements or examples considerably easier. I have also placed important mathematical statements in boxes which are more visible as they have dark backgrounds. Additionally, I have increased the number of marginal notes, and added many more entries to the index.

Many readers and adopters provided invaluable feedback, both in spotting typos and in clarifying vague and even erroneous statements of the book. I would like to acknowledge the contribution of the following people to the correction of errors and the clarification of concepts: Sylvio Andrade, Salar Baher, Rafael Benguria, Jim Bogan, Jorun Bomert, John Chaffer, Demetris Charalambous, Robert Gooding, Paul Haines, Carl Helrich, Ray Jensen, Jin-Wook Jung, David Kastor, Fred Keil, Mike Lieber, Art Lind, Gary Miller, John Morgan, Thomas Schaefer, Hossein Shojaie, Shreenivas Somayaji, Werner Timmermann, Johan Wild, Bradley Wogsland, and Fang Wu. As much as I tried to keep a record of individuals who gave me feedback on the first edition, fourteen years is a long time, and I may have omitted some names from the list above. To those people, I sincerely apologize. Needless to say, any remaining errors in this new edition is solely my responsibility, and as always, I'll greatly appreciate it if the readers continue pointing them out to me.

I consulted the following three excellent books to a great extent for the addition and/or changes in the second edition:

- Greub, W., *Linear Algebra*, 4th ed., Springer-Verlag, Berlin, 1975.
- Greub, W., *Multilinear Algebra*, 2nd ed., Springer-Verlag, Berlin, 1978.
- Kobayashi, S., and K. Nomizu, *Foundations of Differential Geometry*, vol. 1, Wiley, New York, 1963.

Maury Solomon, my editor at Springer, was immeasurably patient and cooperative on a project that has been long overdue. Aldo Rampioni has

been extremely helpful and cooperative as he took over the editorship of the project. My sincere thanks go to both of them. Finally, I would like to thank my wife Sarah for her unwavering forbearance and encouragement throughout the long-drawn-out writing of the new edition.

Sadri Hassani

Preface to First Edition

“Ich kann es nun einmal nicht lassen, in diesem Drama von Mathematik und Physik—die sich im Dunkeln befruchten, aber von Angesicht zu Angesicht so gerne einander verkennen und verleugnen—die Rolle des (wie ich genügsam erfuhr, oft unerwünschten) *Boten* zu spielen.”

Hermann Weyl

It is said that mathematics is the language of Nature. If so, then physics is its poetry. Nature started to whisper into our ears when Egyptians and Babylonians were compelled to invent and use mathematics in their day-to-day activities. The faint geometric and arithmetical pidgin of over four thousand years ago, suitable for rudimentary conversations with nature as applied to simple landscaping, has turned into a sophisticated language in which the heart of matter is articulated.

The interplay between mathematics and physics needs no emphasis. What may need to be emphasized is that mathematics is not merely a tool with which the presentation of physics is facilitated, but the only medium in which physics can survive. Just as language is the means by which humans can express their thoughts and without which they lose their unique identity, mathematics is the only language through which physics can express itself and without which it loses its identity. And just as language is perfected due to its constant usage, mathematics develops in the most dramatic way because of its usage in physics. The quotation by Weyl above, an approximation to whose translation is “*In this drama of mathematics and physics—which fertilize each other in the dark, but which prefer to deny and misconstrue each other face to face—I cannot, however, resist playing the role of a messenger, albeit, as I have abundantly learned, often an unwelcome one,*” is a perfect description of the natural intimacy between what mathematicians and physicists do, and the unnatural estrangement between the two camps. Some of the most beautiful mathematics has been motivated by physics (differential equations by Newtonian mechanics, differential geometry by general relativity, and operator theory by quantum mechanics), and some of the most fundamental physics has been expressed in the most beautiful poetry of mathematics (mechanics in symplectic geometry, and fundamental forces in Lie group theory).

I do not want to give the impression that mathematics and physics cannot develop independently. On the contrary, it is precisely the independence of each discipline that reinforces not only itself, but the other discipline as well—just as the study of the grammar of a language improves its usage and vice versa. However, the most effective means by which the two camps can

accomplish great success is through an intense dialogue. Fortunately, with the advent of gauge and string theories of particle physics, such a dialogue has been reestablished between physics and mathematics after a relatively long lull.

Level and Philosophy of Presentation

This is a book for physics students interested in the mathematics they use. It is also a book for mathematics students who wish to see some of the abstract ideas with which they are familiar come alive in an applied setting. The level of presentation is that of an advanced undergraduate or beginning graduate course (or sequence of courses) traditionally called “Mathematical Methods of Physics” or some variation thereof. Unlike most existing mathematical physics books intended for the same audience, which are usually lexicographic collections of facts about the diagonalization of matrices, tensor analysis, Legendre polynomials, contour integration, etc., with little emphasis on formal and systematic development of topics, this book attempts to strike a balance between formalism and application, between the abstract and the concrete.

I have tried to include as much of the essential formalism as is necessary to render the book optimally coherent and self-contained. This entails stating and proving a large number of theorems, propositions, lemmas, and corollaries. The benefit of such an approach is that the student will recognize clearly both the power and the limitation of a mathematical idea used in physics. There is a tendency on the part of the novice to universalize the mathematical methods and ideas encountered in physics courses because the limitations of these methods and ideas are not clearly pointed out.

There is a great deal of freedom in the topics and the level of presentation that instructors can choose from this book. My experience has shown that Parts I, II, III, Chap. 12, selected sections of Chap. 13, and selected sections or examples of Chap. 19 (or a large subset of all this) will be a reasonable course content for advanced undergraduates. If one adds Chaps. 14 and 20, as well as selected topics from Chaps. 21 and 22, one can design a course suitable for first-year graduate students. By judicious choice of topics from Parts VII and VIII, the instructor can bring the content of the course to a more modern setting. Depending on the sophistication of the students, this can be done either in the first year or the second year of graduate school.

Features

To better understand theorems, propositions, and so forth, students need to see them in action. There are over 350 worked-out examples and over 850 problems (many with detailed hints) in this book, providing a vast arena in which students can watch the formalism unfold. The philosophy underlying this abundance can be summarized as “An example is worth a thousand words of explanation.” Thus, whenever a statement is intrinsically vague or

hard to grasp, worked-out examples and/or problems with hints are provided to clarify it. The inclusion of such a large number of examples is the means by which the balance between formalism and application has been achieved. However, although applications are essential in understanding mathematical physics, they are only one side of the coin. The theorems, propositions, lemmas, and corollaries, being highly condensed versions of knowledge, are equally important.

A conspicuous feature of the book, which is not emphasized in other comparable books, is the attempt to exhibit—as much as it is useful and applicable—interrelationships among various topics covered. Thus, the underlying theme of a vector space (which, in my opinion, is the most primitive concept at this level of presentation) recurs throughout the book and alerts the reader to the connection between various seemingly unrelated topics.

Another useful feature is the presentation of the historical setting in which men and women of mathematics and physics worked. I have gone against the trend of the “ahistoricism” of mathematicians and physicists by summarizing the life stories of the people behind the ideas. Many a time, the anecdotes and the historical circumstances in which a mathematical or physical idea takes form can go a long way toward helping us understand and appreciate the idea, especially if the interaction among—and the contributions of—all those having a share in the creation of the idea is pointed out, and the historical continuity of the development of the idea is emphasized.

To facilitate reference to them, all mathematical statements (definitions, theorems, propositions, lemmas, corollaries, and examples) have been numbered consecutively within each section and are preceded by the section number. For example, 4.2.9 *Definition* indicates the ninth mathematical statement (which happens to be a definition) in Sect. 4.2. The end of a proof is marked by an empty square \square , and that of an example by a filled square \blacksquare , placed at the right margin of each.

Finally, a comprehensive index, a large number of marginal notes, and many explanatory underbraced and overbraced comments in equations facilitate the use and comprehension of the book. In this respect, the book is also useful as a reference.

Organization and Topical Coverage

Aside from Chap. 0, which is a collection of purely mathematical concepts, the book is divided into eight parts. Part I, consisting of the first four chapters, is devoted to a thorough study of finite-dimensional vector spaces and linear operators defined on them. As the unifying theme of the book, vector spaces demand careful analysis, and Part I provides this in the more accessible setting of finite dimension in a language that is conveniently generalized to the more relevant infinite dimensions, the subject of the next part.

Following a brief discussion of the technical difficulties associated with infinity, Part II is devoted to the two main infinite-dimensional vector spaces of mathematical physics: the classical orthogonal polynomials, and Fourier series and transform.

Complex variables appear in Part III. Chapter 9 deals with basic properties of complex functions, complex series, and their convergence. Chapter 10 discusses the calculus of residues and its application to the evaluation of definite integrals. Chapter 11 deals with more advanced topics such as multi-valued functions, analytic continuation, and the method of steepest descent.

Part IV treats mainly ordinary differential equations. Chapter 12 shows how ordinary differential equations of second order arise in physical problems, and Chap. 13 consists of a formal discussion of these differential equations as well as methods of solving them numerically. Chapter 14 brings in the power of complex analysis to a treatment of the hypergeometric differential equation. The last chapter of this part deals with the solution of differential equations using integral transforms.

Part V starts with a formal chapter on the theory of operator and their spectral decomposition in Chap. 16. Chapter 17 focuses on a specific type of operator, namely the integral operators and their corresponding integral equations. The formalism and applications of Sturm-Liouville theory appear in Chaps. 18 and 19, respectively.

The entire Part VI is devoted to a discussion of Green's functions. Chapter 20 introduces these functions for ordinary differential equations, while Chaps. 21 and 22 discuss the Green's functions in an m -dimensional Euclidean space. Some of the derivations in these last two chapters are new and, as far as I know, unavailable anywhere else.

Parts VII and VIII contain a thorough discussion of Lie groups and their applications. The concept of group is introduced in Chap. 23. The theory of group representation, with an eye on its application in quantum mechanics, is discussed in the next chapter. Chapters 25 and 26 concentrate on tensor algebra and tensor analysis on manifolds. In Part VIII, the concepts of group and manifold are brought together in the context of Lie groups. Chapter 27 discusses Lie groups and their algebras as well as their representations, with special emphasis on their application in physics. Chapter 28 is on differential geometry including a brief introduction to general relativity. Lie's original motivation for constructing the groups that bear his name is discussed in Chap. 29 in the context of a systematic treatment of differential equations using their symmetry groups. The book ends in a chapter that blends many of the ideas developed throughout the previous parts in order to treat variational problems and their symmetries. It also provides a most fitting example of the claim made at the beginning of this preface and one of the most beautiful results of mathematical physics: Noether's theorem on the relation between symmetries and conservation laws.

Acknowledgments

It gives me great pleasure to thank all those who contributed to the making of this book. George Rutherford was kind enough to volunteer for the difficult task of condensing hundreds of pages of biography into tens of extremely informative pages. Without his help this unique and valuable feature of the book would have been next to impossible to achieve. I thank him wholeheartedly. Rainer Grobe and Qichang Su helped me with my rusty

computational skills. (R.G. also helped me with my rusty German!) Many colleagues outside my department gave valuable comments and stimulating words of encouragement on the earlier version of the book. I would like to record my appreciation to Neil Rasband for reading part of the manuscript and commenting on it. Special thanks go to Tom von Foerster, senior editor of physics and mathematics at Springer-Verlag, not only for his patience and support, but also for the extreme care he took in reading the entire manuscript and giving me invaluable advice as a result. Needless to say, the ultimate responsibility for the content of the book rests on me. Last but not least, I thank my wife, Sarah, my son, Dane, and my daughter, Daisy, for the time taken away from them while I was writing the book, and for their support during the long and arduous writing process.

Many excellent textbooks, too numerous to cite individually here, have influenced the writing of this book. The following, however, are noteworthy for both their excellence and the amount of their influence:

Birkhoff, G., and G.-C. Rota, *Ordinary Differential Equations*, 3rd ed., New York, Wiley, 1978.

Bishop, R., and S. Goldberg, *Tensor Analysis on Manifolds*, New York, Dover, 1980.

Dennery, P., and A. Krzywicki, *Mathematics for Physicists*, New York, Harper & Row, 1967.

Halmos, P., *Finite-Dimensional Vector Spaces*, 2nd ed., Princeton, Van Nostrand, 1958.

Hamermesh, M., *Group Theory and its Application to Physical Problems*, Dover, New York, 1989.

Olver, P., *Application of Lie Groups to Differential Equations*, New York, Springer-Verlag, 1986.

Unless otherwise indicated, all biographical sketches have been taken from the following three sources:

Gillispie, C., ed., *Dictionary of Scientific Biography*, Charles Scribner's, New York, 1970.

Simmons, G., *Calculus Gems*, New York, McGraw-Hill, 1992.

History of Mathematics archive at www-groups.dcs.st-and.ac.uk:80.

I would greatly appreciate any comments and suggestions for improvements. Although extreme care was taken to correct all the misprints, the mere volume of the book makes it very likely that I have missed some (perhaps many) of them. I shall be most grateful to those readers kind enough to bring to my attention any remaining mistakes, typographical or otherwise. Please feel free to contact me.

Sadri Hassani
Campus Box 4560

Normal, IL 61790-4560, USA
e-mail: hassani@entropy.phyilstu.edu

It is my pleasure to thank all those readers who pointed out typographical mistakes and suggested a few clarifying changes. With the exception of a couple that required substantial revision, I have incorporated all the corrections and suggestions in this second printing.

Note to the Reader

Mathematics and physics are like the game of chess (or, for that matter, like any game)—you will learn only by “playing” them. No amount of reading about the game will make you a master. In this book you will find a large number of examples and problems. Go through as many examples as possible, and try to reproduce them. Pay particular attention to sentences like “The reader may check . . .” or “It is straightforward to show . . .”. These are red flags warning you that for a good understanding of the material at hand, you need to provide the missing steps. The problems often fill in missing steps as well; and in this respect they are essential for a thorough understanding of the book. Do not get discouraged if you cannot get to the solution of a problem at your first attempt. If you start from the beginning and think about each problem hard enough, you *will* get to the solution, and you will see that the subsequent problems will not be as difficult.

The extensive index makes the specific topics about which you may be interested to learn easily accessible. Often the marginal notes will help you easily locate the index entry you are after.

I have included a large collection of biographical sketches of mathematical physicists of the past. These are truly inspiring stories, and I encourage you to read them. They let you see that even under excruciating circumstances, the human mind can work miracles. You will discover how these remarkable individuals overcame the political, social, and economic conditions of their time to let us get a faint glimpse of the truth. They are our true heroes.

Contents

1	Mathematical Preliminaries	1
1.1	Sets	1
1.1.1	Equivalence Relations	3
1.2	Maps	4
1.3	Metric Spaces	8
1.4	Cardinality	10

16	Integral Transforms and Differential Equations	493
16.1	Integral Representation of the Hypergeometric Function	494
16.1.1	Integral Representation of the Confluent Hypergeometric Function	497
16.2	Integral Representation of Bessel Functions	498
16.2.1	Asymptotic Behavior of Bessel Functions	502
16.3	Problems	505
Part V Operators on Hilbert Spaces		
17	Introductory Operator Theory	511
17.1	From Abstract to Integral and Differential Operators	511
17.2	Bounded Operators in Hilbert Spaces	513
17.2.1	Adjoint of Bounded Operators	517
17.3	Spectra of Linear Operators	517
17.4	Compact Sets	519
17.4.1	Compactness and Infinite Sequences	521
17.5	Compact Operators	523
17.5.1	Spectrum of Compact Operators	527
17.6	Spectral Theorem for Compact Operators	527
17.6.1	Compact Hermitian Operator	529
17.6.2	Compact Normal Operator	531
17.7	Resolvents	534
17.8	Problems	539
18	Integral Equations	543
18.1	Classification	543
18.2	Fredholm Integral Equations	549
18.2.1	Hermitian Kernel	552
18.2.2	Degenerate Kernels	556
18.3	Problems	560
19	Sturm-Liouville Systems	563
19.1	Compact-Resolvent Unbounded Operators	563
19.2	Sturm-Liouville Systems and SOLDEs	569
19.3	Asymptotic Behavior	573
19.3.1	Large Eigenvalues	573
19.3.2	Large Argument	577
19.4	Expansions in Terms of Eigenfunctions	577
19.5	Separation in Cartesian Coordinates	579
19.5.1	Rectangular Conducting Box	579
19.5.2	Heat Conduction in a Rectangular Plate	581

19.5.3	Quantum Particle in a Box	582
19.5.4	Wave Guides	584
19.6	Separation in Cylindrical Coordinates	586
19.6.1	Conducting Cylindrical Can	586
19.6.2	Cylindrical Wave Guide	588
19.6.3	Current Distribution in a Circular Wire	589
19.7	Separation in Spherical Coordinates	590
19.7.1	Radial Part of Laplace's Equation	591
19.7.2	Helmholtz Equation in Spherical Coordinates	593
19.7.3	Quantum Particle in a Hard Sphere	593
19.7.4	Plane Wave Expansion	594
19.8	Problems	595

Part VI Green's Functions

20	Green's Functions in One Dimension	605
20.1	Calculation of Some Green's Functions	606
20.2	Formal Considerations	610
20.2.1	Second-Order Linear DOs	614
20.2.2	Self-adjoint SOLDOS	616
20.3	Green's Functions for SOLDOS	617
20.3.1	Properties of Green's Functions	619
20.3.2	Construction and Uniqueness of Green's Functions	621
20.3.3	Inhomogeneous BCs	626
20.4	Eigenfunction Expansion	630
20.5	Problems	632
21	Multidimensional Green's Functions: Formalism	635
21.1	Properties of Partial Differential Equations	635
21.1.1	Characteristic Hypersurfaces	636
21.1.2	Second-Order PDEs in m Dimensions	640
21.2	Multidimensional GFs and Delta Functions	643
21.2.1	Spherical Coordinates in m Dimensions	645
21.2.2	Green's Function for the Laplacian	647
21.3	Formal Development	648
21.3.1	General Properties	648
21.3.2	Fundamental (Singular) Solutions	649
21.4	Integral Equations and GFs	652
21.5	Perturbation Theory	655
21.5.1	The Nondegenerate Case	659
21.5.2	The Degenerate Case	660
21.6	Problems	661
22	Multidimensional Green's Functions: Applications	665
22.1	Elliptic Equations	665
22.1.1	The Dirichlet Boundary Value Problem	665
22.1.2	The Neumann Boundary Value Problem	671
22.2	Parabolic Equations	673
22.3	Hyperbolic Equations	678
22.4	The Fourier Transform Technique	680

22.4.1	GF for the m -Dimensional Laplacian	681
22.4.2	GF for the m -Dimensional Helmholtz Operator . . .	682
22.4.3	GF for the m -Dimensional Diffusion Operator . . .	684
22.4.4	GF for the m -Dimensional Wave Equation	685
22.5	The Eigenfunction Expansion Technique	688
22.6	Problems	693

Part VII Groups and Their Representations

23	Group Theory	701
23.1	Groups	702
23.2	Subgroups	705
23.2.1	Direct Products	712
23.3	Group Action	713
23.4	The Symmetric Group S_n	715
23.5	Problems	720
24	Representation of Groups	725
24.1	Definitions and Examples	725
24.2	Irreducible Representations	728
24.3	Orthogonality Properties	732
24.4	Analysis of Representations	737
24.5	Group Algebra	740
24.5.1	Group Algebra and Representations	740
24.6	Relationship of Characters to Those of a Subgroup	743
24.7	Irreducible Basis Functions	746
24.8	Tensor Product of Representations	750
24.8.1	Clebsch-Gordan Decomposition	753
24.8.2	Irreducible Tensor Operators	756
24.9	Problems	758
25	Representations of the Symmetric Group	761
25.1	Analytic Construction	761
25.2	Graphical Construction	764
25.3	Graphical Construction of Characters	767
25.4	Young Operators	771
25.5	Products of Representations of S_n	774
25.6	Problems	776

Part VIII Tensors and Manifolds

26	Tensors	781
26.1	Tensors as Multilinear Maps	782
26.2	Symmetries of Tensors	789
26.3	Exterior Algebra	794
26.3.1	Orientation	800
26.4	Symplectic Vector Spaces	801
26.5	Inner Product Revisited	804
26.5.1	Subspaces	809
26.5.2	Orthonormal Basis	812

26.5.3	Inner Product on $\Lambda^p(\mathcal{V}, \mathcal{U})$	819
26.6	The Hodge Star Operator	820
26.7	Problems	823
27	Clifford Algebras	829
27.1	Construction of Clifford Algebras	830
27.1.1	The Dirac Equation	832
27.2	General Properties of the Clifford Algebra	834
27.2.1	Homomorphism with Other Algebras	837
27.2.2	The Canonical Element	838
27.2.3	Center and Anticenter	839
27.2.4	Isomorphisms	842
27.3	General Classification of Clifford Algebras	843
27.4	The Clifford Algebras $\mathbf{C}_\mu^{\nu}(\mathbb{R})$	846
27.4.1	Classification of $\mathbf{C}_n^0(\mathbb{R})$ and $\mathbf{C}_0^n(\mathbb{R})$	849
27.4.2	Classification of $\mathbf{C}_\mu^{\nu}(\mathbb{R})$	851
27.4.3	The Algebra $\mathbf{C}_3^1(\mathbb{R})$	852
27.5	Problems	856
28	Analysis of Tensors	859
28.1	Differentiable Manifolds	859
28.2	Curves and Tangent Vectors	866
28.3	Differential of a Map	872
28.4	Tensor Fields on Manifolds	876
28.4.1	Vector Fields	877
28.4.2	Tensor Fields	882
28.5	Exterior Calculus	888
28.6	Integration on Manifolds	897
28.7	Symplectic Geometry	901
28.8	Problems	909
Part IX Lie Groups and Their Applications		
29	Lie Groups and Lie Algebras	915
29.1	Lie Groups and Their Algebras	915
29.1.1	Group Action	917
29.1.2	Lie Algebra of a Lie Group	920
29.1.3	Invariant Forms	927
29.1.4	Infinitesimal Action	928
29.1.5	Integration on Lie Groups	935
29.2	An Outline of Lie Algebra Theory	936
29.2.1	The Lie Algebras $\mathfrak{o}(p, n - p)$ and $\mathfrak{p}(p, n - p)$	940
29.2.2	Operations on Lie Algebras	944
29.3	Problems	948
30	Representation of Lie Groups and Lie Algebras	953
30.1	Representation of Compact Lie Groups	953
30.2	Representation of the General Linear Group	963
30.3	Representation of Lie Algebras	966
30.3.1	Representation of Subgroups of $GL(\mathcal{V})$	967

30.3.2	Casimir Operators	969
30.3.3	Representation of $\mathfrak{so}(3)$ and $\mathfrak{so}(3, 1)$	972
30.3.4	Representation of the Poincaré Algebra	975
30.4	Problems	983
31	Representation of Clifford Algebras	987
31.1	The Clifford Group	987
31.2	Spinors	995
31.2.1	Pauli Spin Matrices and Spinors	997
31.2.2	Spinors for $C_\mu^v(\mathbb{R})$	1001
31.2.3	$C_3^1(\mathbb{R})$ Revisited	1004
31.3	Problems	1006
32	Lie Groups and Differential Equations	1009
32.1	Symmetries of Algebraic Equations	1009
32.2	Symmetry Groups of Differential Equations	1014
32.2.1	Prolongation of Functions	1017
32.2.2	Prolongation of Groups	1021
32.2.3	Prolongation of Vector Fields	1022
32.3	The Central Theorems	1024
32.4	Application to Some Known PDEs	1029
32.4.1	The Heat Equation	1030
32.4.2	The Wave Equation	1034
32.5	Application to ODEs	1037
32.5.1	First-Order ODEs	1037
32.5.2	Higher-Order ODEs	1039
32.5.3	DEs with Multiparameter Symmetries	1040
32.6	Problems	1043
33	Calculus of Variations, Symmetries, and Conservation Laws	1047
33.1	The Calculus of Variations	1047
33.1.1	Derivative for Hilbert Spaces	1047
33.1.2	Functional Derivative	1050
33.1.3	Variational Problems	1053
33.1.4	Divergence and Null Lagrangians	1060
33.2	Symmetry Groups of Variational Problems	1062
33.3	Conservation Laws and Noether's Theorem	1065
33.4	Application to Classical Field Theory	1069
33.5	Problems	1073
Part X Fiber Bundles		
34	Fiber Bundles and Connections	1079
34.1	Principal Fiber Bundles	1079
34.1.1	Associated Bundles	1084
34.2	Connections in a PFB	1086
34.2.1	Local Expression for a Connection	1087
34.2.2	Parallelism	1089
34.3	Curvature Form	1091
34.3.1	Flat Connections	1095
